

Btrfs and Rollback

How It Works and How to Avoid Pitfalls

Thorsten Kukuk

Senior Architect SUSE Linux Enterprise Server

kukuk@suse.com

rm -rf / ?

I will be discussing what is needed for rollback:

- Btrfs / Copy-on-Write / Subvolumes
- Rollback on openSUSE/SUSE Linux Enterprise
- Grub2 and rollback
- Caveats and risks
- Cleanup of snapshots
- Managing subvolumes

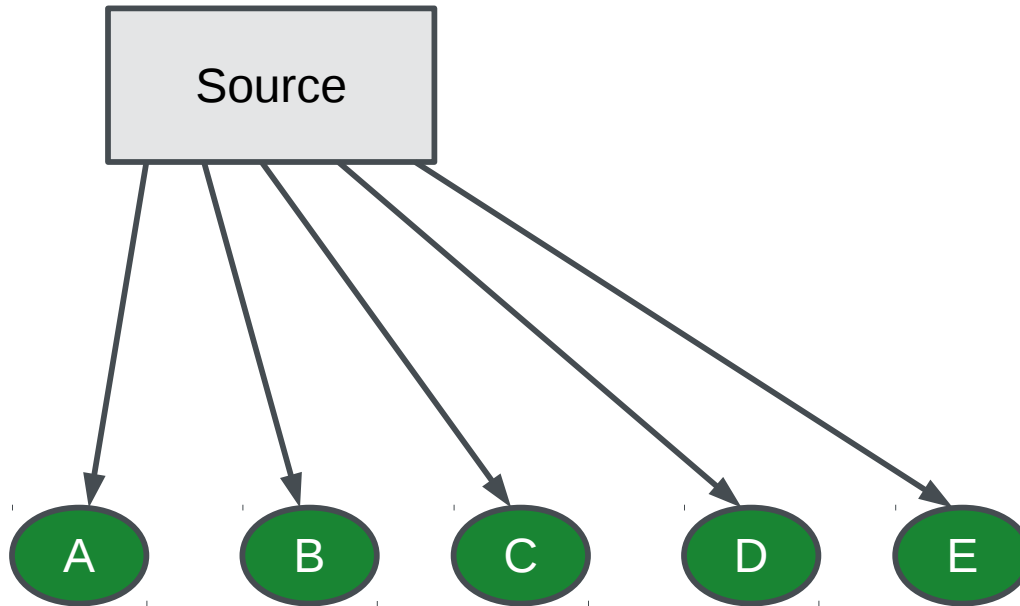

Btrfs / Subvolumes

- Not like a LVM logical volume
- Are hierarchical
- Can be accessed in two ways:
 - From the parent subvolume (like a directory)
 - Separate mounted filesystem (using subvol/subvolid)
- Every btrfs filesystem has a default, top-level subvolume with id 5
- Snapshots are subvolumes, which shares its data with other subvolumes (snapshots)
- Only subvolumes can be the source for snapshots

Btrfs / CoW

- Copy on Write (CoW) general purpose file system
- Trees for
 - Data
 - Metadata
- Snapshots
 - Every snapshot is again a subvolume
 - Can be mounted and accessed like every other subvolume
 - Snapshots can be created read-only

Btrfs / Copy-on-Write (1/4)

Btrfs / Copy-on-Write (2/4)

Btrfs / Copy-on-Write (3/4)

Btrfs / Copy-on-Write (4/4)

Btrfs Snapshots and Diskusage

- How much disk space does a snapshot need?

The answer nobody likes: It depends!

- Initial snapshot: few Bytes for Metadata
- Growing over time when original data changes
- At the end: same amount as original data
- Worst case: Lot of snapshots and no common blocks between them.

Why?

But ...

... what happens, if the kernel does not boot?

Btrfs

on openSUSE / SUSE Linux Enterprise

- Default root filesystem for root partition (incl. /boot)
- Advantage: rollback including kernel
- Bootloader can boot from btrfs
- Rollback per subvolume
- Rollback integrated into bootloader
- No consistent snapshots cross partition boundaries
- No automatic snapshots per cron for root filesystem

Full System Rollback

Rollback per Subvolume (1/2)

How it works

- Instead of the original subvolume, the snapshot is mounted with the options “subvol=<name>”
 - Remember: snapshots are subvolumes
 - “*btrfs subvolume set-default ...*” for permanent assignments
- Implemented in Snapper as “rollback”

Rollback per Subvolume (2/2)

- Benefits

- “atomic” operation
- Very fast

- Disadvantages

- Additional complexity
 - Requires explicit mounting of subvolumes
 - Subvolumes can prevent snapshots from being deleted
- “Disk space leaks”
 - Initial installation needs to be done into an extra subvolume

Reboot *Later* Mode

- Administrator is in a current read-write filesystem, but wants to rollback
- “snapper list” to view and select a snapshot
- Call “snapper rollback <number>”, which will:
 - Create a new read-only snapshot of the currently running system
 - Create a new read-write snapshot of the snapshot <number>, linearly after the just recently created read-only snapshot
 - “setdefault” to the new read-write snapshot
- Then reboot

Reboot Now Mode

- Boot into an existing read-only snapshot
- Text console and some services should work
 - Because most data is in writeable subvolumes
- To continue to work in this snapshot, call “*snapper rollback*”. This will:
 - Create a new read-only snapshot of the old read-write one
 - Create a new read-write snapshot of the current read-only one
 - All linearly after the last existing snapshot
 - “setdefault” to the new read-write snapshot
- Then reboot

User View on Snapshot History

Condensed view

What happens,
if we rollback again?

Caveat: this does not reflect 1:1 what happens technically.

User View On grub2 Interface

Snapper Headers

- **Type:** [Pre | Post | Single]
- **#:** Nr of snapshot
- **Pre #:** if type is “Post” the matching Pre nr.
- **Date:** timestamp
- **Cleanup:** cleanup algorithm for this snapshot
- **Description:** A fitting description of the snapshot (free text)
- **Userdata:** key=value pairs to record all sorts of useful information about the snapshot in an easily parsable format

Important Snapshots

Snapshots are marked as important (“*”), if a package affecting the boot process is updated:

- kernel
- dracut
- glibc
- systemd
- udev

You can configure that in `/etc/snapper/zypp-plugin.conf`

Modify grub2 menu

The text in the grub2 menu can be set by the admin:

- `snapper modify --userdata="bootloader=foo bar"`
[number]
 - [number] = number of the snapshot

SLES12

Advanced options for SLES12

Start bootloader from a read-only snapshot

SLES 12 (3.12.28-4,2014-10-17T09:07,pre,zypp{zypper})

SLES 12 (3.12.28-4,2014-10-17T08:59,post)

*SLES 12 (3.12.28-4,2014-10-17T08:59,post)

*SLES 12 (3.12.28-4,2014-10-17T08:59,pre,zypp{y2base})

SLES 12 (3.12.28-4,2014-10-17T08:53,pre,yast sw_single)

SLES 12 (3.12.28-4,2014-10-17T08:46,post)

SLES 12 (3.12.28-4,2014-10-17T08:46,pre,yast users)

```

g227:~ # snapper list
Type | # | Pre # | Date | User | Cleanup | Description | Userdata
-----|-----|-----|-----|-----|-----|-----|-----
single | 0 | | | root | | current | |
pre | 3 | | Fri Oct 17 10:46:22 2014 | root | number | yast users | |
post | 4 | 3 | Fri Oct 17 10:46:49 2014 | root | number | | |
pre | 5 | | Fri Oct 17 10:53:14 2014 | root | number | yast sw_single | |
pre | 6 | | Fri Oct 17 10:59:12 2014 | root | number | zypp(y2base) | important=yes

```

Caveats and Risks

Snapshotting “/” – Challenges

- Consistent system / “atomic”
 - We cannot do that cross partition boundaries
- Kernel and initrd / initramfs = “/boot”
 - /boot not as extra partition
- Different stages of bootloader needs to match
 - Exclude /boot/grub2/<grub2 arch> from snapshot
 - Grub2 configuration is part of the snapshot
 - new grub2 needs to be able to read old configs

Data and Rollback

I made a rollback, but ...

... what happens with my new data???

System Integrity and Compliance

Don't allow to roll back certain log-files, databases etc.

Solution: subvolumes instead of directories for

- /boot/grub2/*
- /opt
- /srv
- /tmp
- /usr/local
- /var/crash
- /var/lib/{mailman,named,pgsql,mysql}
- /var/log
- /var/opt
- /var/spool
- /var/tmp

What Can Be Broken After a Rollback?

- /home/<user> exists
 - but no entry in /etc/passwd
 - /opt can contain Add-Ons
 - but dependencies are no longer fulfilled
 - /srv can contain web applications
 - but wrong php/ruby on rails version installed
 - Database was not in a subvolume or extra partition
 - all data after creating the snapshot for rollback is lost
- Copy modified data from snapshot of old root subvolume into new root subvolume

Cleanup of snapshots

Automatic Cleanup of Snapshots

- Old snapshots are automatically deleted
 - Depending on “Cleanup” field (snapper list)
 - Cron job – once a day
- Snapshots containing subvolumes cannot be deleted
 - Have one subvolume and create all other subvolumes in it
- Root snapshots/subvolumes are excluded
 - Even old ones after rollback
 - Prevent deletion by accident

Automatic Cleanup of Snapshots

- Timeline Snapshots
 - Disabled by default for root partition
 - First snapshot of the last 10 days/months/years are kept
- Installation Snapshots/Administration Snapshots
 - New snapshot when calling YaST or zypper
 - Last 10 important snapshots are kept
 - Last 10 “regular” snapshots are kept

Managing Subvolumes

Handling of Subvolumes

Subvolumes are automatically mounted with their parent volume

- Past: Only the root subvolume in `/etc/fstab`
- Now: All subvolumes are listed in `/etc/fstab`

Why?

- After rollback, old subvolumes are not part of the new parent subvolume!

How to Create a Subvolume

- Move old directory (/path/name) away
- Mount “original” root and create subvolume:
 - *Mount /dev/sda2 -o subvol=@ /mnt*
 - *btrfs subvolume create /mnt/path/name*
 - *umount /mnt*
- Add new subvolume to /etc/fstab and mount it:
 - *echo “/dev/sda2 /path/name btrfs subvol=@/path/name 0 0” >> /etc/fstab*
 - *mkdir /path/name*
 - *mount /path/name*
- Move old data back into new subvolume

How to Delete a Subvolume

- Create temporary directory `/path/name.tmp`
- Copy data into this directory
- Delete subvolume:
 - *`btrfs subvolume delete /path/name`*
- Remove `/path/name` from `/etc/fstab`
- Move temporary directory to original name:
 - *`mv /path/name.tmp /path/name`*

Sources

Upstream Sources and Patches (1/2)

- Grub2

- Patches are needed (Not everything accepted upstream, from <https://build.opensuse.org/package/show/Base:System/grub2>):
 - grub2-btrfs-01-add-ability-to-boot-from-subvolumes.patch
 - grub2-btrfs-02-export-subvolume-envvars.patch
 - grub2-btrfs-03-follow_default.patch
 - grub2-btrfs-04-grub2-install.patch
 - grub2-btrfs-05-grub2-mkconfig.patch
 - grub2-btrfs-06-subvol-mount.patch
 - grub2-snapper-plugin.sh

Upstream Sources and Patches (2/2)

- Snapper
 - Version 0.2.4 or greater
 - No patches needed
 - <ftp://ftp.suse.com/pub/projects/snapper/>

Missing Answer

rm -rf /

Is it now safe?

Missing Answer

rm -rf /

Is it now safe?

No!

Missing Answer

rm -rf /

Is it now safe?

No!

Why not?

It will not stop on subvolumes.

Questions?

Thank you.
