

# Linux and Open Source Software

*Applying the Learnings of the Past to the Future*

AI Gillen  
GVP, Software Development and Open Source  
February, 2017

- **Looking way (way) back**
- **Today's Realities & Challenges**
- **The Growing Role of Open Source Software Beyond Linux**
- **Essential Guidance**

# State of the Industry in 2001

- In February 2001.....
  - George W. Bush had just been sworn in as 43<sup>rd</sup> president
  - Wikipedia went online Jan 15
  - FTC approved merger of AOL and Time Warner
  - MacOS X was about to release (on March 24)
  - Windows XP would release in August
  - The .COM bust was in full swing; stock market was on the way to a low point later in the year
  - Much of the market's losses blamed on over-valued tech companies, pumped up by Internet-sized expectations
  - Meanwhile, Linux was scoring wins with its low/no cost of acquisition for budget-starved IT shops

# IDC Linux Marketplace Study, 2001

Respondent motives for moving to Linux are strikingly consistent with the 1999 data – it's the economy

- Price, reliability, COO seen as advantages
- Built-in features attractive
- Open source, Internet cited as motivations
- Internet-ready diminishing value; becomes “the fabric”
- Thankfully, “believe in Linux” was fading as a driver (more mainstream adopters)

# Linux Hurdles Cited

Skills set and fragmentation have increased as factors that might limit Linux deployment

11

- Skills was the #1 or #2 challenge
- Skills challenge still rings true today
- Skill shortages today for emerging projects/prods
- We hear the same concerns related to:
  - OpenStack
  - Containers
  - DevOps
  - CNAs
  - IoT
  - And....

# State of the Industry in 2008

- In February 2008.....
  - iPhone had been on the market for 8 months
  - Oil had crossed \$100/barrel for the first time in January
  - Stock markets around the world plunge on fears of a recession caused by the US subprime mortgage crisis
  - On Feb 5, DJIA falls 370 points, S&P drops 3.2%. On September 29, the Dow would drop 777 points
  - Fidel Castro about to announce his resignation (2/24)
  - In June, Bill Gates steps down from chairman post
  - IDC presents “*The Role of Linux as a Next Generation Business Server*” at The Linux Foundation Collaboration Summit in April, 2008

# From IDC's 2008 Presentation

## Server Deployment User or Intentions Sorted on 2004-2006 shifts (3% or > change)

E6. For which of these server workloads do you use or intend to use Linux?

Jan-17

# Top-Down Credibility

## *Setting the Stage for Future Open Source Software*

- Grass roots not growing: Linux gains credibility with top management
- Mission-critical workloads and acquisition of enterprise servers growing

E2b. Which of the following statements best describes your org's strategy and direction regarding Linux on servers?

- Looking way (way) back
- **Today's Realities & Challenges**
- The Growing Role of Open Source Software Beyond Linux
- Essential Guidance

# State of the Industry in 2017

- In February 2017....
  - Donald Trump had just sworn in as 45<sup>rd</sup> president
  - Stock market surpassed 20,000 for the first time
  - Ubiquity of online content, social media fosters info overload; mass dissemination of misinformation
  - Dell-EMC Merger recently completed
  - HPE paring back SW portfolio w/sale to Micro Focus
  - Amazon and VMware announced cloud partnership
  - MSFT acquires LinkedIn; Xamarin; joins Linux Foundation

# Paid vs. Nonpaid Server OS Forecasts

Worldwide Operating Systems Shipments, Subscriptions and Nonpaid Deployments, 2007-2020 (000)

# Digital Transformation Becomes Key

## Standardization of Infrastructure

## Interconnection of Systems

## Intellectual Property

## Social Data, Mobile Data

## IoT and Other Data

## Decision Support

## Real Time Analytics

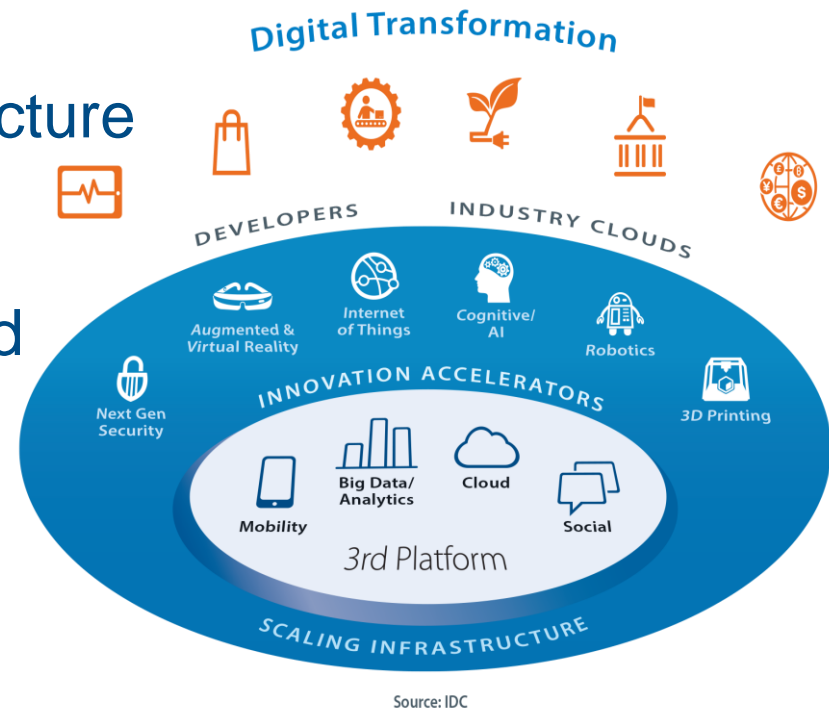

# Digital Transformation Made Possible by Open Source Technologies including Containers, Cloud Native Apps

## To remain competitive:

- Embrace standardized infrastructure
- Modernize apps application
- Embrace DevOps, priv/pub cloud

## Standard infrastructure enables:

- Rapid iteration
- Disruption of competitors
- Deployment flexibility

# Applications Become the Pivot Point

- Apps divide into “legacy-” and “cloud-native” apps
  - Most of today’s installed apps will eventually move to, and live on in cloud ... forever
  - Few applications become true cloud applications; even *fewer need to*
  - Expect a lot of “lift and shift” where existing apps are plunked into a container and run in cloud, in their full monolithic glory
- Starting points dictate end points for existing applications
  - MSFT will move Win apps to MSFT cloud
  - VMware unlikely to migrate Windows apps off Windows
  - Linux apps move to public cloud on Linux
- Cloud native apps will emerge as the new battleground
  - Every vendor is scrambling to field a viable CNA strategy
  - Opportunities grow to manage, migrate and lifecycle legacy apps
  - CNAs will present opportunity, but expect a round of consolidation among current high-flying startups in the CNA space.

# How Customers Feel About Infrastructure

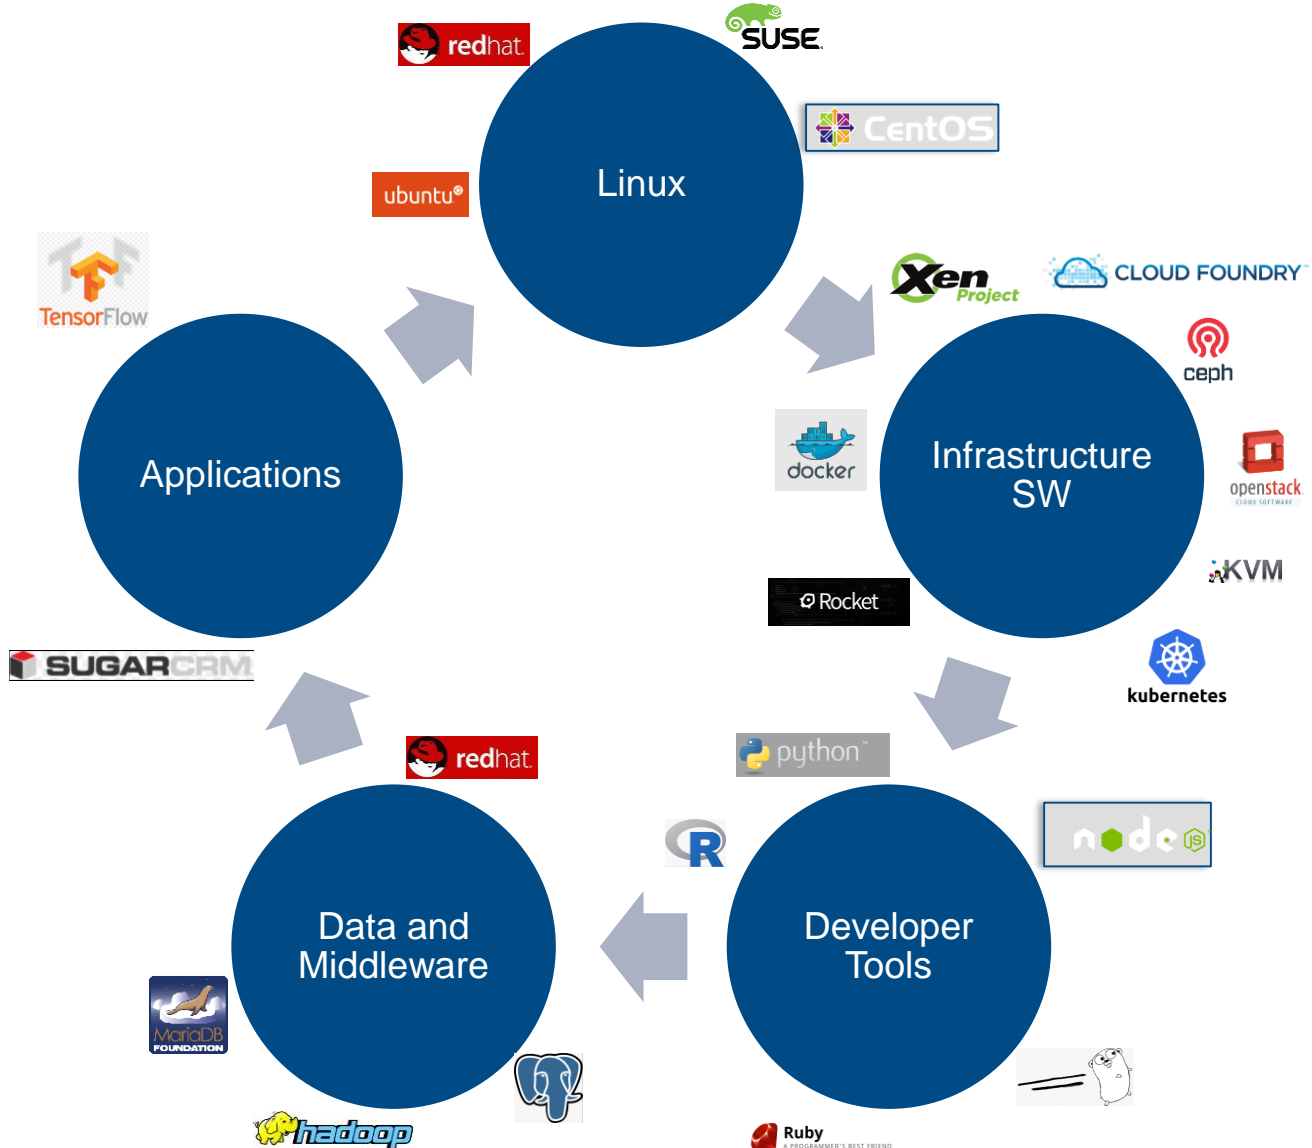

- Classic apps are married to a given OS/system software stack
- Cloud native apps not married in the same way, but....
- Transitions are slow, but most growth is in new deployments
- Virtualization was a key enabler, but today is at a crossroads
- Standardization remains one key focus area for IT
  - Standardization is a precursor for future cloud adoption
  - Meanwhile, virtualization still a key onramp for private/hybrid cloud
- Application design is fundamentally changing
  - OS APIs are something to be avoided, not embraced
  - App frameworks key to next generation PaaS adoption
  - Old apps stay on current framework, probably forever

- Looking way (way) back
- Today's Realities & Challenges
- The Growing Role of Open Source Software Beyond Linux
- Essential Guidance

# Open Source in Today's World

# Enterprises Prefer Commercialized DevOps Open Source Products Technologies

**Q: Rank order your organization's preferences for sourcing options that will be used to acquire DevOps enabling technologies over the next two years with 1 as the most preferred type**

# Process Fragmentation, Lack of Mature Product DevOps Challenges

Q: What are your organization's top technology challenges when implementing DevOps?

- Smaller enterprises more likely to think workloads are not suited for DevOps
- Largest orgs most likely to suffer from fragmented processes

n = 100 multiple selections permitted Source: IDC, Early Adopter DevOps Survey, IDC, July, 2016

- **Looking way (way) back**
- **Today's Realities & Challenges**
- **The Growing Role of Open Source Software Beyond Linux**
- **Essential Guidance**

# Essential Guidance

- Cloud native apps will be architected very differently
- App frameworks, data structures, deployments changing
- Cloud-native apps seek to be more platform independent
- A Darwin evolution of containers + orchestration not done yet
- Development of containerized apps still in infancy among large organizations; but adoption will become strong
- Most existing apps won't be replaced/rebuilt; rather will be augmented and extended using cloud native apps
- Open source software is increasingly becoming the foundation for modern apps, and the tooling for building them
- Training, skills enablement has been, continues to be a drag

# Thank You
